

Exoscale Liquid-Cooled GPU: Powering AI, Sustainably

Unlock Maximum Performance with up to 50% Energy Savings.

Artificial Intelligence (AI) and Machine Learning (ML) drive the rapid evolution of digital innovation and the surge in data center energy demands. To address this pressing challenge, Exoscale, in partnership with Austrian startup Diggers, offers a revolutionary liquid-cooling solution for AI workloads. Our cutting-edge system delivers up to 50% in energy savings. It enables up to 98% reuse of captured thermal energy, setting a new benchmark for high-performance, sustainable cloud infrastructures.

Key Benefits

Up to 50% Reduction in Energy Consumption

Lower operational costs and environmental impact by replacing traditional air-cooling systems with a highly efficient liquid-cooling design.

Up to 98% Heat Reuse

Capture and redistribute thermal energy for district heating or other hot-water applications, boosting sustainability.

Uncompromised GPU Performance

Maintain optimal operating conditions for the GPUs under heavy computational loads—ideal for large-scale Machine Learning and LLM training initiatives.

Sustainability and ESG Compliance

Our aluminum-based cooling technology offers excellent recyclability and corrosion resistance, while the impact calculator based on Cloud Assess ensures complete transparency on sustainability metrics.

Easy Integration

Compact, self-contained modules fit standard 19" racks without requiring raised floors or extensive HVAC infrastructure.

“ Everything was extremely smooth, and nothing bulged, even when everyone hit the servers simultaneously. It’s my first time seeing a workshop with models running so smoothly! The stability and performance of Exoscale’s GPUs allowed over 50 participants to deploy and experiment with state-of-the-art LLMs without bottlenecks seamlessly. Access to a sovereign and scalable European cloud provider is a real asset for researchers and developers working on AI.”

Andrei Kucharavy, Assistant Professor, Co-head of the GenLearning Center, HES-SO Valais-Wallis
Cyril Vallez, Machine Learning Engineer, Hugging Face

Why It Matters

The energy consumption of AI and ML workloads is rising dramatically, with conventional cooling systems struggling to keep pace. Traditional cooling alone can account for up to 30% of a data center’s energy use.

Exoscale’s direct-to-chip liquid-cooling approach eliminates this bottleneck by cooling GPUs and CPUs at the source, minimizing airflow requirements, and offering a future-proof path toward greener AI infrastructure. It’s a leap forward in both **operational efficiency** and **sustainability**.

PRESS RELEASE

Exoscale was founded in 2011, is headquartered in Switzerland, and is member of A1 Digital – part of the A1 Group. The cloud provider empowers businesses and engineers to run their workloads and applications securely in the cloud. The user-friendly, reliable, and high-performing platform makes Exoscale an ideal partner for cloud-native deployments. With the rigorous focus on security and data protection, Exoscale ensures safe, GDPR-compliant cloud usage at every step.
